EXECUTIVE SUMMARY

The results obtained from the annual emissions test of Gilroes Crematorium shows that cremators and abatement systems were compliant with the PG 5/2 (2012) requirements for the release of pollutants to atmosphere.

Gilroes Stream 1 - Cremators 1 & 2 & Abatement System Emissions Monitoring November 2022

| | Emission Result | Emission Limit Values PG5/2 (2012) | Compliant | Non-Compliant |
|--|-----------------|---------------------------------------|-----------|---------------|
| Total Particulate Matter - mg/Nm ³ c. | 2.08 | <20 | ✓ | |
| Hydrogen Chloride - mg/Nm ³ c. | 0.96 | <30 | ✓ | |
| Carbon Monoxide - mg/Nm ³ c. | 14.47 | <100 | ✓ | |
| Organic Compounds - mg/Nm ³ c. | 3.24 | <20 | ✓ | |
| Mercury - µg/Nm ³ c. | 1.06 | <50 | ✓ | |

Note 1: All emissions as concentration levels are corrected to 11% v/v oxygen and dry gas

Note 2: Where multiple tests are performed for a given pollutant the emission result represents the average reading.

Gilroes Stream 2 - Cremators 3 & 4 & Abatement System Emissions Monitoring November 2022

| | Emission Result | Emission Limit Values PG5/2 (2012) | Compliant | Non-Compliant |
|--|-----------------|---------------------------------------|-----------|---------------|
| Total Particulate Matter - mg/Nm ³ c. | 4.83 | <20 | ✓ | |
| Hydrogen Chloride - mg/Nm ³ c. | 5.52 | <30 | ✓ | |
| Carbon Monoxide - mg/Nm ³ c. | 8.22 | <100 | ✓ | |
| Organic Compounds - mg/Nm ³ c. | 2.25 | <20 | ✓ | |
| Mercury - µg/Nm ³ c. | 4.91 | <50 | ✓ | |

Note 1: All emissions as concentration levels are corrected to 11% v/v oxygen and dry gas

Note 2: Where multiple tests are performed for a given pollutant the emission result represents the average reading.

1. INTRODUCTION

The four cremators and two associated flue gas abatement systems at Gilroes Crematorium, Groby Road, Leicester, LE3 9QG were monitored on the 8th, 9th & 10th November 2022 to the requirements given in Process Guidance Note PG5/2 (2012) for emission releases to atmosphere.

The work was carried out on site by the following staff of Davies & Co (Engineering) Limited:

EA MCERTS Level 2
MCERTS No: MM 18 1510

EA MCERTS Trainee
MCERTS No: N/A

All test methods employed are the preferred methods given in the Environment Agency Technical Guidance Document M2 and Process Guidance Note PG 5/2 (2012) and were carried out using calibrated equipment. All analysis was conducted using UKAS approved methods.

The work on site involved monitoring the flue gas components after the flue gas abatement system fitted to the cremator with the plant operating normally.

The plant being tested comprises four cremators of model type FTIII, fitted with two nozzle-mix burners utilising natural gas as the support fuel.

The waste gases from Cremators 1 and 2 combine and are ducted to a common flue gas treatment plant which, throughout this report, is referred to as Stream 1. The treatment plant comprises a shell and tube boiler to cool the flue gases, a reagent feeder station that introduces a blend of activated carbon/sodium bicarbonate to react with the cooled gases, and a bag filter to clean the treated gases. The waste heat from the boiler in the form of warm water is dissipated to atmosphere via a finned tube air blast cooler situated outside the crematory.

The waste Gases from Cremators 3 and 4 combine and are ducted into a second flue gas treatment plant operating in the same manner as the plant attached to Cremators 1 and 2. This plant is referred to as Stream 2 throughout this report.

The plant operates under full microprocessor based automatic control that requires little manual intervention.

The cremators and flue gas abatement system were manufactured, installed and commissioned by Facultatieve Technologies Limited to meet the requirements of the Environmental Permitting (England & Wales) Regulations 2016 (EPR 2016) as relevant to new crematoria installations, summarised in Process Guidance Note PG5/2 (2012).

Measurements were undertaken to enable comparisons to be made of the operation of the cremators and associated abatement system with the requirements in terms of emission releases to air.

This report details the monitoring procedures used and the results obtained from this test work along with comparisons with the requirements and comments where appropriate.

Relevant procedures were followed to enable quality control to be maintained throughout the test preparation, site test work, laboratory analysis, calculations, and reporting.

The flue ducting and test points were in accordance with the requirements of EA TGN M1. Photographs of the sampling location are given below:

Stream 1:

Stream 2:

2. PROCEDURES

2.1 Total Particulate Matter

A flue gas sample was extracted and filtered to collect total particulate matter. A 47mm QMA filter paper was used with a particle retention of not less than 99.5% at a particle size of 0.3 micron. The flue gas extraction employed techniques given in BS EN 13284 Part 1.

The method employed was BS EN 13284 Part 1.

The sampling was conducted using apparatus in accordance with the requirements of BS EN 13284 Part 1.

This consisted of a heated known dimension Titanium nozzle, heated Titanium probe liner, heated Titanium filter housing with PTFE coated stainless steel frit containing glass microfibre filter (all heaters set to 160°C), PTFE sample line, borosilicate glass absorption impingers, gas dryer (silica gel), sample line to pump, pump, gas meter, critical orifice & digital manometer, pitot and impulse lines, type K thermocouple, balance (for gravimetric moisture) and datalogger. Calculations were performed to enable isokinetic flow to be maintained (based on online measurements of flue gas velocity and temperature to set nozzle flow / pump rate (l/min)).

Particulate matter analysis was carried out by weighing the filter and probe rinse collection on a calibrated balance, with the media being dried and weighed prior to and following the test.

Standard BS EN 13284 Part 1 was deviated from only in so far as a consequence of conducting tests in accordance with the requirements of PG5/2(12) that requires total particulate matter to be sampled for one hour of cremation. This therefore implies that only one sampling line can be used for each test run as sampling on 2 lines would require a stop halfway through the test to move the probe out of one port and into another thus losing a period within the allotted one hour needed to obtain an hourly average as required by PG5/2(12). This is contrary to BS EN 13284 Part 1 that requires 2 sample lines to be used during an isokinetic test i.e., four-point sampling (2 points x 2 lines) for a duct of this diameter.

The effect on uncertainty of using only one sample line is not considered to be significant and assumed to be within the calculated uncertainties stated in this report. These assumptions are on the basis that the preliminary pitot traverses confirmed the gas velocity profiles were well within required limits, and the duct dimensions were relatively small (350 mm diameter) considering the scope of BS EN 13284 Part 1. The duct was compliant with the requirements of the Standard in terms of duct dimensions and length measurements as well as meeting all requirements of Environment Agency Technical Guidance Note M1. In accordance with the Standard flue gas was sampled at 2 representative points along the sample line and as such there is no reason to suspect that the gas sampled from only one sampling line is not representative of the duct.

This recommended deviation is a reflection that cremation is a batch process, and that changing sampling ports part-way through a cremation could introduce more errors due to fact that a period of each cremation would not be sampled during the changeover process.

The tests reported herein were conducted to prove the performance of the cremator relative to PG 5/2 (2012).

A comparison of the test results was made with the continuous particulate emission monitor.

2.2 Hydrogen Chloride

A flue gas sample was extracted and filtered. A 47mm QMA filter paper was used with a particle retention of not less than 99.5% at a particle size of 0.3 micron. The flue gas extraction employed techniques given in BS EN 13284 Part 1.

The sampling was conducted using apparatus in accordance with the requirements of BS EN 13284 Part 1.

The method employed was BS EN 1911 Parts 1-3.

Laboratory analysis for hydrogen chloride was carried out on the absorption medium using Ion Chromatography (IC).

2.3 Mercury

A flue gas sample was extracted and filtered to collect solid phase mercury.

A 47mm QMA filter paper was used with a particle retention of not less than 99.5% at a particle size of 0.3 micron. The flue gas extraction employed techniques given in BS EN 13284 Part 1.

The gas sample was then passed through an absorption medium of acidified potassium dichromate to collect vapour phase mercury.

The method employed was BS EN 13211.

Laboratory analysis for solid and vapour phase mercury was carried out on the filter and absorption medium using Inductively Coupled Plasma (ICP-OES) Spectrophotometry.

2.4 Carbon Monoxide

A flue gas sample was continuously extracted, filtered, and dried before being passed through a pre-calibrated Horiba PG-350 infrared analyser for the on-line measurement of carbon monoxide.

The method employed was BS EN 15058.

The analyser has an MCERTS certification range of 0-75 & 0-6250 mg/Nm³ and was zeroed with nitrogen and calibrated with a nominal 160 ppm carbon monoxide in balance nitrogen gas.

The analyser output was continuously recorded to an SD card using the inbuilt data logger.

For these tests, a relatively high range analyser was used due to the typical pattern of carbon monoxide concentration emissions from cremators being very low (often indicated as zero) for most of the cycle, but with occasional, high, short duration spikes of CO being emitted. The convention since non-continuous emissions monitoring became a mandatory requirement for cremators during 1990, has been to attempt to monitor the magnitude of spikes, as these are often the main contributor to total CO emissions. If, for example, a mean one-minute emission of CO was 100 mg/Nm³, it would be expected that the peak concentration during that one-minute averaging period would be considerably higher than this. It follows that utilising a lower range analyser would frequently underestimate CO emissions, despite increasing sensitivity at low CO concentrations.

2.5 Total Organic Compounds

A flue gas sample was continuously extracted and filtered before being passed via a heated line through a pre-calibrated SK-Elektronik GmbH Flame Ionisation Detection (FID) analyser for the on-line measurement of volatile organic compounds. The analyser was ranged 0-100 ppm (with autoranging for higher concentrations if required) total hydrocarbons and was zeroed with synthetic air and calibrated with a nominal 80 ppm propane in balance air gas.

The method employed was BS EN 12619.

The analyser output was continuously recorded using the inbuilt data logger.

Similar comments apply to TOC's as CO, in that the analyser scaling is set to quantify the peaks that are the nature of the emission.

2.6 Oxygen

A flue gas sample was continuously extracted, filtered, and dried before being passed through a pre-calibrated Horiba PG-350 paramagnetic analyser for the on-line measurement of flue oxygen.

The method employed was BS EN 14789.

The analyser was calibrated with nitrogen "zero" gas and nominal 21% Oxygen in balance nitrogen gas.

The analyser output was continuously recorded to an SD card using the inbuilt data logger.

2.7 Moisture

A flue gas sample was extracted and filtered. The gas sample was then passed through an absorption medium to collect any water vapour.

The method employed was BS EN 14790.

Flue gas moisture was determined gravimetrically by weighing the absorption medium and final gas drier prior to and following the test.

This was carried out alongside testing for hydrogen chloride and mercury.

2.8 Temperature

Flue gas temperature was measured using a calibrated Type K thermocouple.

The method employed was BS EN 13284 Part 1.

The flue gas temperature was continuously recorded using a KIMO digital thermomanometer.

2.9 Velocity and Volumetric Flow

Flue gas velocity was found from inserting a calibrated s-type pitot tube into the flue. The pitot head pressure was then measured and continuously recorded using a KIMO digital thermomanometer.

The method employed was BS EN 13284 Part 1.

Flue gas velocity was then calculated from Bernoulli's equation as the density of the flue gas was known (from measurements of flue gas moisture and temperature).

Flue gas volumetric flow rate was found from the measurement of the flue duct size and hence its area and corrected to normalised conditions (again from measurements of flue gas moisture and temperature).

3. RESULTS

The results are summarised in Tables 1 - 6.

Total Particulate Matter and Hydrogen Chloride determinations are given in Tables 1 & 3 for Streams 1 & 2 respectively.

Mercury determinations are given in Tables 2 & 4 for Streams 1 & 2 respectively.

Comparison of Test Results with site instrumentation is given in Tables 5 & 6 for Streams 1 & 2 respectively.

Carbon Monoxide, Total Organic Compounds, Oxygen, Temperature and Velocity and Volumetric Flow were continuously monitored.

All values in the tables are corrected to the reference conditions of 273K, 101.3kPa, 11%v/v oxygen and dry gas as given in PG5/2(12) where required.

All data logs and calculations can be seen in Appendix 1.

All analysis reports can be seen in Appendix 2.

4. COMMENTS

The results obtained from this monitoring test work show compliance with the requirements given in Process Guidance Note PG5/2 (2012) for both Stream 1 and Stream 2 cremators and abatement systems.

The results are expressed in the summary tables as concentration levels as this is understood to be the basis of the permit issued by the regulator.

The cremators and flue gas clean up systems operated satisfactorily during testing without any failure or alarm events.

All coffins charged were constructed of standard materials to the knowledge the site operator and testing technicians.

No visible chimney emissions were observed throughout the test work.

PG5/2 (2012) states that the continuous emissions monitors (CEMs) should be periodically checked (calibrated) to ensure that the readings being reported are correct.

The CEM's on site are regularly maintained, checked, and calibrated in accordance with the manufacturer's recommendations, and were functional at the time of the tests.

The PCME particulate monitor primarily functions as a filter leak detector rather than being calibrated to give qualitative results. This instrument is more than capable of satisfying this function.

Tables 5 and 6 show some correlation between the onsite and periodic Carbon Monoxide measurements, with an overestimation given by the onsite instrumentation on both streams.

5. QUALITY CONTROL

All the tests performed were carried out to the methods given in the appropriate listed Standards using calibrated equipment. The gas analyser was calibrated prior to use using suitable calibration gases.

Analysis of the absorber solutions was carried out at an external UKAS laboratory following UKAS approved analysis methods.

For this test work the following external laboratory was used for the given determination:

| | | |
|------------------|---|-------------------|
| RPS Laboratories | } | Hydrogen Chloride |
| | | Mercury |

APPENDIX 1

Data Logs and Calculations

Explanation of Data Logs

Data is taken from analyser internal loggers and KIMO digital thermomanometer.

Times are synchronised to exact time.

Flue Gas Temp is direct from test flue thermocouple.

Meter Temp is direct from gas meter.

(The stated meter temperature is that of the sampled gas at the meter and is not the room ambient temperature. The temperature always increases during a test due to the heat gain from the sample pump that is contained in an enclosed box along with the gas meter, and this is quite normal).

Flue O₂ is from the Horiba PG-350 analyser.

CO is from the Horiba PG-350 analyser.

TOC is from the SK-Elektronik GmbH FID analyser expressed as carbon equivalent.

Sample Point Pa is from the pitot tube to a KIMO electronic manometer.

The room temperature was typically 20°C, and there were no issues with the analysers overheating.

Functional and calibration checks at the start and end of each test confirmed correct operation of the analysers.

All values in the tables are corrected to the reference conditions of 273K, 101.3kPa, 11%v/v oxygen and dry gas as given in PG5/2(12) where required.

Certificate of Analysis

Report No.: 22-14196-1

Issue No.: 1
Date of Issue: 28/11/2022

Customer Details: Envirocare (Stack), Bradford Chamber Business Park, New Lane, Bradford, BD4 8BX

Customer Contact:

Customer Order No.: EK-0219 ETC-35106

Customer Reference: Not Supplied

Quotation Reference: Q22-04556

Description: 10 liquid samples

Date Received: 15/11/2022

Date Started: 16/11/2022

Date Completed: 28/11/2022

Test Methods: Details available on request (refer to SOP code against relevant result/s)

Notes: None

Approved By:

Operational Manager

This certificate is issued in accordance with the accreditation requirements of the United Kingdom Accreditation Service.

This certificate shall not be reproduced except in full without the prior written approval of the laboratory.

Observations and Interpretations are outside of the scope of UKAS accreditation.

Results reported herein relate only to the items supplied to the laboratory for testing.

Results on an Interim Report are not dry-weight corrected.

Where the laboratory is not responsible for the sampling, results apply to the sample(s) as they were received.

The laboratory shall not be responsible for any information that is supplied by the customer that may affect the validity of results.
